another exciting Sigma Force adventure. James Rollins' Seventh Plague returns a group of Sigma Forces, this time to save the world from the plague, starting with the biblical disasters of Egypt. The Seventh Plague first comes into contact with an Egyptian woman who sacrifices her life knowing that she carries the plague and its secrets. Moving forward for several millennia to the mid-19th century, the crisis reappears with new players trying to find a cure: Mark Twain, Nikola Tesla, and Henry Morton Stanley; Enter David Livingstone as a background character. Putting these characters aside, the real story begins when Professor Harold McCabe, a bio-archaeologist, stumbles out of Sudan after being mysteriously lost for two years. The professor does not survive, and his body is brought to London, where an autopsy is to be conducted. The professor's disappearance two years earlier leaves many unanswered questions, especially if someone on his team survived. His sudden and unexpected appearance and subsequent death causes emotional stress in his colleagues, Safa al-Maaz and Derek Rankin, and his daughter Gene McCabe. The autopsy goes awry from the beginning, when an unusual microbe was found in the professor's brain; his body was self-mummified. Chaos is coming. Enter Sigma Force. Safa, watching the autopsy, realizes that something terrible is happening, and calls his girlfriend, the artist Crowe, the director of the secret Sigma Force. When she talks to him through her computer and when he listens to her story, she confirms that she believes that the professor died from exposure to the ancient plague. Suddenly, a flash of the muzzle shoots around the room. Safa is under attack, and the monitor turns black. Unexplained deaths are beginning to occur in different parts of the world, and Sigma Force is actively going to find the cause and cure for this plague. Through a series of related clues left by Dr. McCabe, the group travels in two different directions to gather information. Kat Bryant and artist Crowe follow the trail of evidence on Ellesmere Island in Canada, where they find Safa, as well as Rory McCabe, son of Professor Harold McCabe, and one of the lost members of the expedition. They fall into the clutches of billionaire Simon Hartnell, whose goal is to harness the power of the virus to provide an endless source of electricity for the world. To do this, he plans to sow the external atmosphere with these microbes, feeding on electricity, regardless of the possible consequences. But he needs Safa and Rory to decipher the hieroglyphics that were found with the mummy of a woman who died more than 2,000 years ago. At the same time, the rest of the crew, Monk Kokkalis, Seichen and Grayson Pierce, find themselves in England, tracking the whereabouts of the daughters of Professor McCabe, Gene, and Derek Rankin. And the race goes as the Sigma Force crew arrives just in time to save Gene and Derek from capture by unknown force. Within this group is a woman trained the same group that originally trained Seichen as a murderer. Two women have played cat and mouse games throughout history, trading places as hunter and hunted. While Kat in Canada can remove Safa and Rory from the takeover, the artist is not so lucky, and he is left to accomplish the impossible: stop Simon Hartnell before he reaches his goal. On the other side of the world, Grayson Pierce and his group follow the keys left by tracking a cure for a disease that is spreading around the world. Their pursuit leads them from England to Egypt to Sudan, where they are confronted with a mysterious force that continues their attempt to kidnap Gene McCabe. Throughout history, Rollins plants have tantalizing clues for both groups to follow. In The Typical Rollins style, he puts his characters in impossible situations and drops out of them at the very last moment. It should be noted, however, that the seventh plague is not his best effort. Despite its intriguing scenes, the first two-thirds of the book are sometimes confusing, and the keys are hard to follow. His use of historical characters such as Mark Twain, Nikola Tesla, Henry Morton Stanley, and David Livingstone is at times clever, at other times a stretch. Suffice it to say, without giving away an ending that was both exciting and sometimes poignant, Rollins fans will take the book for its full value - another thrilling Sigma Force adventure. This summer, Iran's Lake Urmia has evolved from green to blood-red as a result of microorganisms that thrive on salt and light. The bloody waterfalls of Antarctica get their scarlet hue from bacteria lurking in the briny water beneath the glacier there. The salt-loving microbes of the archaea turn the Great Salt Lake into pink pink. //news.nationalgeographic.com/20... 2) About HMS Terror told of an infected Inuit, having stumbled upon a large dead man in a dark room on a ship, with a big smile. Experts that may have been a rictus smile, or evidence that a person suffered from scurvy. A scrawled note dated April 25, 1848, hidden in a stone cairn at Victory Point on the northern island of King William, says that Erebus and Terror had been abandoned three days earlier, stuck in sea ice. The survivors appeared to be hoping to follow the river - now known as the Back River - south to safety at Hudson's Bay fur trade outpost. No one has done so, and for generations, the accepted historical narrative described a brutal death march as Royal Navy sailors tried to get out of the Arctic, dying along the way. Now Franklin experts will have to discuss whether at least some of the dying sailors, rather than gathering incredible strength, are fighting hunger, disease and frostbite, in a desperate attempt to sail home. //www.livescience.com/56110-doom...3) Mark Twain was a very rational and skeptical man. One famous legend surrounding the eccentric Tesla was in his lab in Manhattan, which shook his building and nearly destroyed the neighborhood during experiments. Tesla's device wasn't really an earthquake machine, Carlson said, but a high-frequency oscillator. The piston set under the platform in the lab shook strongly as it moved, another experiment in more efficient electricity. He didn't bring the block to ruin, Carlson said, but he did shake the feed out of Mark Twain. Twain was known for digestive problems, so Tesla, who knew Twain through a gentleman's club, invited him. He instructed Twain to stand on the platform while he flipped the oscillator. After about 90 seconds, Twain jumped off the platform and ran after objects. The collaboration itself is not very unique - species from honeybees to lions cooperate in different ways, but what these animals understand about how collaboration works controversially, Carpenter added. For many species, collaboration probably doesn't require much cognition at all, since much of the behavior is programmed. While such a task seems simple, it can prove difficult for many animals, Carpenter said. When testing in a similar way, crows and their relatives, which research increasingly shows are extremely intelligent, do not wait for their partner. HAARP does not cause earthquakes. The aim of the program is to understand the physics of the ionosphere, which constantly responds to the influence of the sun. Solar flares can send solar particles hurtling toward Earth, sometimes disrupting communication and electrical grid. If scientists could better understand what's going on in the ionosphere, they could mitigate some of these problems. In May 2014, the Air Force announced that the HAARP program would be closed later in 2014. While the experiments ended in the summer of 2014, the full and dismantling the dismantling was adjourned until at least May 2015. In mid-August 2015, control of the facility and its equipment was transferred to the University of Alaska Fairbanks. David Livingstone's body has been specially preserved in salt in the hope of saving his corpse for the long journey back to London. There's nothing mysterious about that. Taking the biblical story as a possible qualitative description of the event, Florida oceanographer Doron Nof set out to find out whether the Red Sea stretching was physically plausible. Using a common phenomenon called the wind section effect, he found that a northwesterly wind of 20 m/s blowing at 10-14 h was sufficient to cause sea level drops of about 2.5 m. Although scholars agree that the effect of harvesting the wind could have led to the Red Sea parting, as described in the Bible, most biblical scholars and archaeologists insist that the Israel crossing did not take place in the Red Sea at all. Before he parted, no matter how much he parted, the Bible describes Moses and his brother Aaron delivering 10 chums to the people of Egypt. The Nile turns to blood, all the fish dies, the frogs are carried out profusely, and so on. Drawing on theology, Egyptology and biology, epidemiologist John Marr developed a domino theory to explain each of the 10 plagues in order. Marr believes the plagues were a series of natural disasters and diseases caused by the flowering of water-transmitted organisms called dinoflagellates. Dinoflagellates painted the Nile and killed the fish eaten by the frogs, which in turn caused a demographic explosion among the frogs. Contaminated water eventually killed the frogs, causing lice and flies to run rampant, leading to a number of animal diseases (including African horse disease) and outbreaks of boils (fantasy glanders). This reign of calamities and diseases continued through hail, locusts (Schistocerca gregaria, to be exact), and sandstorms to the death of first-born sons, which Marr believes was caused by grain infected with mycotoxins. Others, drawing on Marra's domino theory, claim that the plague was caused by the eruption of the Greek island of Santorini, causing a number of disasters, such as those that occurred on Lake Nyes, Cameroon, in 1986. Although not as spectacular as the plague or saying goodbye to the Red Sea, the meeting of Moses with a burning bush is a key moment in the history of Easter and, for a long time, has been a source of much scientific speculation. As the story goes, God speaks to Moses from the burning bush and tells him, I came down to put (Israelis) out of the hand of the Egyptians. And the bush is not consumed. Humphries believes the bush continued to burn because of natural gas or the volcanic vent beneath it. Others pointed to the work of Norwegian physicist Doug Christian Diste and his article on the subsoil use of organic material in Mali, stating that the bush could burn spontaneously. As for the voice of God, Benny Shanon, a professor of psychology at the Hebrew University, suggests that Moses at the time stumbled upon a hallucinogenic substance similar to ayahuasca. Shanon further argues that the representation of the Ten Commandments may have been a mass hallucination. Thunder, lightning and the roar of the pipe, which, as the Book of Exodus says, came from Mount Sinai, could simply be the representations of the people in a changed state of awareness. Speculating that God's voice is a hallucination, Shanon, like Freud before him, tries to question the basics of monotheism. //channel.nationalgeographic.com/... More...
